ForgeRock is a global Identity and Access Management software company that helps people safely and simply access the connected world. ForgeRock delivers a modern, comprehensive digital identity platform designed for any cloud environment to provide exceptional, secure digital experiences for workforce, consumers, and things.

# How ForgeRock delivers a leading Access Management Platform with digital identities

## Challenge

ForgeRock set out to build an all-in-one identity and access management platform with the adaptive intelligence to continuously protect against risk-based threats and drive personalisation across users, devices, and things.

This solution provides access to a set of services (or nodes), which can be added together to build a personalised authentication journey. Within this ecosystem, ForgeRock wanted to offer clients the ability to connect their custom-built authentication flows to a verified digital identity.

"

*"Our customers want to streamline the process of onboarding and authenticating their users. Tools like Yoti allow for a better user experience while providing a definitive identity, which creates a strong base for a trusted relationship."*

**Ben Goodman** - SVP of Corporate and Business Development at ForgeRock

## Solution

We built a node for the ForgeRock marketplace that clients can simply drag and drop into their multi-factor authentication tree. The Yoti node taps into our consumer app that allows anyone to create a digital ID using their government-issued ID document and a quick face scan. Once verified, the end user can use their Yoti Digital ID to share identity details by scanning a QR code. Businesses can configure this QR code and request the attribute they need, ranging from full name to an ID document and their biometric template.

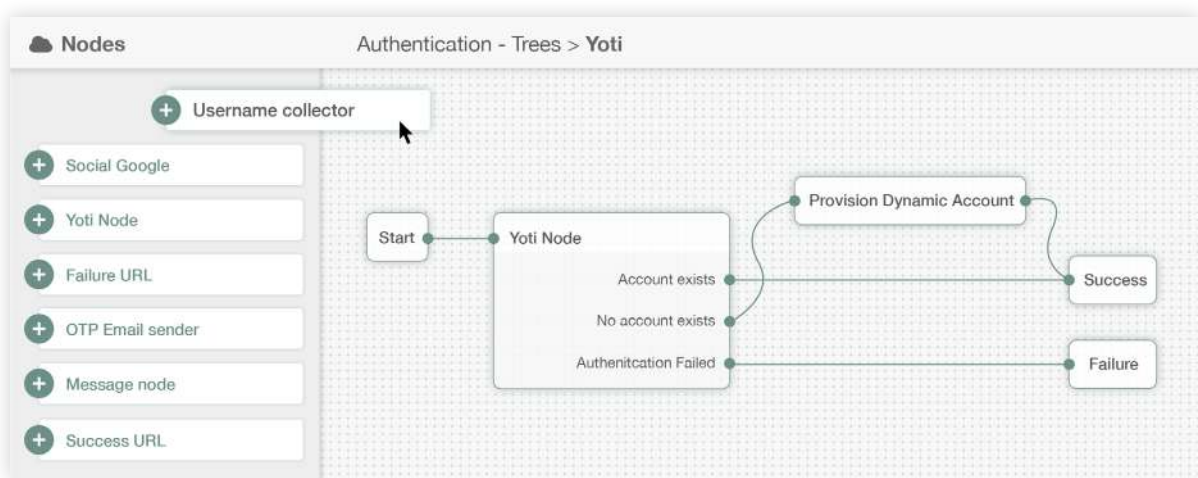

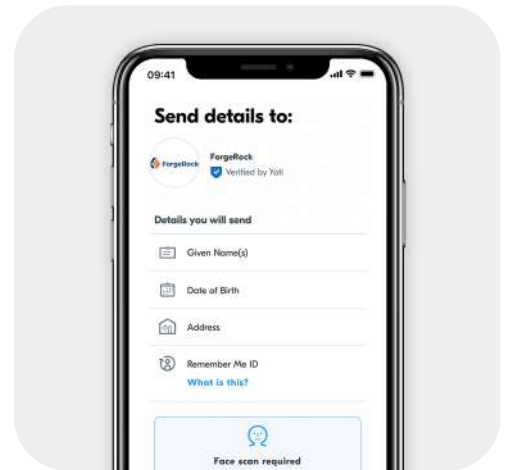

Building an authentication journey on the ForgeRock Access Management platform

## Results

Biometric authentication is one of the most fool-proof ways of knowing that the right person is accessing your service or system. With Yoti, ForgeRock can harness the power of digital ID to be used as a secure MFA tool within a larger, customisable user onboarding channel.

Clients can configure the QR code that is shown to the end user to request the identity attributes they need. This level of customisability enhances the level of personalisation offered by the ForgeRock Access Management solution and gives it a considerable competitive advantage. It also allows businesses to deliver a more convenient method of authentication for the end user, allowing them to sign in to services using their phone.

The Yoti node is compatible with the ForgeRock Access Management solution, enabling customers to integrate seamlessly with our technology and harness our reusable biometric authentication tool delivered straight to the hands of the consumer. We look forward to working with ForgeRock to deliver our combined, enhanced solution to improve the security of services and systems worldwide.
